

Link Between Alzheimer's and Hearing Loss

by NEWLIFEOUTLOOK TEAM

Is Hearing Loss a Warning Sign of Dementia?

Hearing loss is very common as we age, but did you know it could also be an indication that Alzheimer's or another form of dementia may be on the way?

By 65, around one in three people have experienced some hearing loss. When you lose your hearing certain nerves in your brain become less active, resulting in reduced overall brain activity, which increases your likelihood of developing dementia.

If you are concerned you may be losing your hearing, see your doctor about possible solutions.

Staying as active as you can, both physically and mentally, is the best way to reduce your chances of developing Alzheimer's. Getting regular exercise like walking for 30 minutes every day and keeping your brain ticking with things like learning new skills and doing puzzles can help keep you sharp.

Read on to learn more about Alzheimer's and hearing loss.

The Link Between Hearing Loss and Dementia

The Link Between Alzheimer's and Hearing Loss

Many of the symptoms associated with early Alzheimer's disease are the same as those associated with hearing loss. In fact, among those over 60, hearing loss accounted for over one-third of the risk of developing dementia and Alzheimer's.

Looking at the Numbers

Hearing Loss

According to the World Health Organization hearing loss is not being able to hear sounds of 20 decibels or less in the speech frequencies.

48 Million people in the United States experience some type of hearing loss.

At age 65, 1 out of every 3 people have hearing loss.

60% of Veterans of the war in Iraq & Afghanistan experienced hearing loss upon return.

Men are more likely than women to experience hearing loss.

Hearing impairment occurs in about **18%** of American adults between ages 45 and 54, **30%** of adults between ages 65 and 74, and **47%** of adults ages 75 and older.

Alzheimer's

Alzheimer's is a type of dementia that causes problems with memory, thinking and behavior. Symptoms usually develop slowly and get worse over time.

Most common type of dementia accounts for **60-80%** of all dementia cases.

More than **5 million** Americans are living with the disease.

Every **67 seconds** someone in the United States develops Alzheimer's.

The Most Common Symptoms of Both

As Hearing Loss Increases, So Does Your Dementia Risk

Many of the symptoms associated with early Alzheimer's disease are the same as those associated with hearing loss. In fact, among those over 60, hearing loss accounted for over one-third of the risk of developing dementia and Alzheimer's.

Brain and Hearing

The Effects of Hearing Loss on the Brain

"We listen with our ears but hear with our brains"

George Gates, M.D.
Hearing Expert at University of Washington

Dangers of an Inactive Brain

- Alzheimer's disease leads to nerve cell death and tissue loss throughout the brain. Over time, the brain shrinks dramatically, affecting nearly all its functions.
- The cells can tangle, which cut off nutrient flows. The cells eventually die.
